DETAILED ACTION

Allowable Subject Matter

1. Claims 1, 4, 7-9, 12, 14-17, 19-21, 23-25, 27, 29-31, 33 and 34 are allowable
2. The following is an examiner's reason for allowance:
 - a. Regarding claims 1, 9 and 31, Kadous et al. (US 20030095508) discloses channel estimation in an OFDM system.

The instant invention discloses quantizing a channel response function of a signal received from a transmitter or a residual value of the channel response function, wherein the channel response function is represented by M complex numbers, wherein a channel estimate is subtracted from the channel response function to provide the residual value; limiting the channel response function to N complex numbers where N is less than M, wherein the N complex numbers are limited to values having time delays less than a predetermined delay spread; converting the signal from a frequency domain representation of the signal to a time domain representation of the signal prior to said quantizing; and generating a channel state information packet to be transmitted back to the transmitter, wherein the packet includes the quantized channel response function when the packet is a first feedback packet sent to the transmitter or a first feedback packet sent after a channel interruption, and includes the quantized residual value of the channel response function otherwise, and wherein the channel state information permits the transmitter to obtain a channel state estimation.

The combination of the above features in the claims are neither taught, suggested nor made obvious by Kadous et al.

b. Regarding claims 17, 21 and 25, Kadous et al. (US 20030095508) discloses channel estimation in an OFDM system.

The instant invention discloses parsing a channel state information packet received from a device after transmitting a signal to the device to obtain a quantized channel response function of the signal, wherein the device converts the signal from a frequency domain representation of the signal to a time domain representation of the signal prior to quantization, wherein the channel state information packet includes the quantized channel response function when the packet is a first feedback packet sent to the transmitter or a first feedback packet sent after a channel interruption and includes a quantized residual value of the channel response function otherwise, wherein a channel estimate is subtracted from the channel response function to provide the residual value; and dequantizing the quantized channel response function to provide a channel response function, wherein the channel response function is an estimate of the channel response function, wherein the estimate of the channel response function is represented by N complex numbers, wherein the channel response function is represented by M complex numbers, and wherein N is less than M.

The combination of the above features in the claims are neither taught, suggested nor made obvious by Kadous et al.

c. All the pending independent claims are allowable based on their dependency on claims 1, 9, 17, 21, 25 and 31.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submission should be clearly labeled "Comment on Statement of Reasons for Allowance".
